team-33

Functionality	- The application works with zip files which contains multiple submissions. - Supports comparison of multiple files at a time - Final similarity score is calculated after comparing ASTs like most of the other teams
UI/Usability	- The flow in UI is straightforward. - The way similarity is being displayed is confusing, especially the code blocks. - We must go through the files manually to get hold of the similarities. - While displaying the similarity, all the blocks from one file are rendered first in a group followed by the similar blocks from the second file in a second group. This is a huge let down since there is a lot of text. - When there are more than two submissions inside the zip file or the contents are huge, there is a lot of scrolling involved which is not exactly user friendly.
Installation	- Have given simple installation instructions which can be followed easily to get the system up and running
Code Review	- Have used maven for dependency tracking which is good - Have documented their backend and frontend code well - Design patterns have been implemented properly - Have followed the MVC pattern - - tests lack comments
Documentation	- User manual has been provided as a part of the Readme file - The instructions have been described well - Installation instructions are also clear and simple - No extra documentation submitted
Tests	- Another team which has written test cases for their Angular UI - Unit test cases for backend could be more exhaustive. For example, the team has not tested whether someone can do script injection from the frontend. - System tests could be more exhaustive as well.
Process	- Have followed the git workflow well - Have not tracked their work items inside the git issue tracker
HW5 Responses	- 60 incoming issues - Have responded to the issues on time and within the deadline
Other	- Support for zip files is a plus in this project. No other team has done this feature
Final Score	**89**
